

ABSTRACT OF THE INVENTION

An image input/output apparatus includes an image-capturing device that captures an image of a subject placed on a stage and a projection-type display device that generates an image based upon an input image signal and projects the image onto a screen. If the image-capturing device is detected to be in the operating state, an illuminating lamp and a projection lamp are turned on and one of the input terminals is selected at a selection means switch. Thus, the image signal from the image-capturing device is selected and an image based upon the image signal is projected from the projection-type display device.
